# Toggleable Hood Instructions

For the toggleable hood mesh, both the up and down hood meshes are on the model. The way the toggle works is by hiding whatever hood is not currently active by using the UV tile discard. The UV tile discard disables or enables the tile when you select or deselect it in unity.

If you want the hood to go down, you have to find the blendshape for the hoodie mesh called "Hood Down" and set it to 100%. After you set the blendshape, go to the material in unity and scroll until you see a tab called "Special FX". Under the tab, you should see another tab called "UV Tile Discard". When you open the tab, you should see another drop down and a grid of squares:

The hoodie has two UV maps: one for the texture itself and another for the tile discard function. The tile discard UV is set as “UV1”.

You can animate these toggles along with the blendshape for the hood.

When you want to put the hood down, set the blendshape “Hood Down” to 100% and animate the second square on row v = 0 to be off while setting the first square on row v = 1 to be on.

If you want to put the hood up, do the inverse of how to put it down.

If you want to disable the entire hoodie, just disable the mesh entirely.

Hopefully this helps!
